

Serum Soundbank Installation Guide

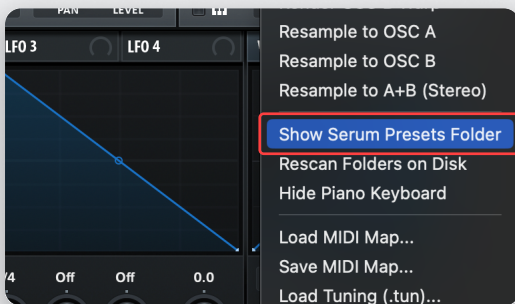

Need help? Email us at support@stickz.co

Windows & Mac Installation

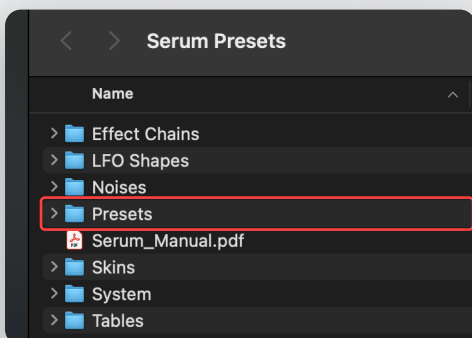

[1] Open Serum and hit the "**MENU**" button in the top-right corner.

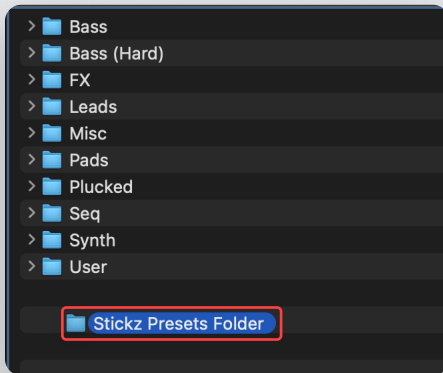

[2] Select the "**Show Serum Presets folder**" option.

[3] Once the Serum data folder opens, open the folder named "**Presets**".

[4] Grab the newly downloaded presets folder with all our **.FXP** preset files inside, and drag it into the Serum "**Presets**" folder.

[5] **Reload Serum & enjoy!** The new presets now show up within the standard Serum preset browser.

Ensure that you fully reload Serum, or select the "**Rescan Folders on Disk**" option within the Serum menu to reload the Serum database. Otherwise, the newly installed presets won't appear in Serum's browser.

Compatibility

We recommend using the latest version of Serum to avoid any compatibility issues. If any of our presets crash your DAW, crash your Serum instance, introduce crackling sounds and pops, or can't be opened at all, you're most likely using an outdated version of Serum.

Note that we did not develop Serum. If you need to update your Serum instance or need help updating, reach out to the developers at <https://xferrecords.com/>
